## *The Centauri Adapter...*

1. Can be installed with VFD's, conventional pressure switches, or other types of controls. They are very easy to use and install
2. Eliminate the use of a tank tee.
3. Installer can change a gauge or pressure control device without draining the system down.
4. They work very well in high mineral water systems to eliminate scale and mineral build up on control surfaces.
5. The Centauri Adapter is installed directly to the Schrader valve and any common captive air tank. This allows placement of the sensor / transducer to be free of turbulence which is a common problem when water is exiting the system in front of the sensor / transducer. (I.E. Hydrants installed directly off the main trunk line of the well system.) The Centauri Adapter promotes smooth operation in a properly sized VFD water well system.
